

Steamer for Fabric relaxation

Our **Steamer machine** has been designed to relax all kind of fabrics, by means of the effect of the steam in all kind of fibres or its blends, specifically with elastic and knitted goods.

☒ The main **technical advantages** of our STEAMING machine are:

1. **Fabric opening device** by means of stainless steel cylinders feeding the fabric to the steamer dully opened.
2. **Fabric feeding** by means of one drive cylinder.
3. **Fabric is driven by means of one conveyor belt** inside the steaming chamber. The fabric circulates inside the chamber free of tensions and with its natural and best shrinking conditions.
4. **Full automatic synchronisation between the conveyor belt and the feeding cylinder** to achieve the maximum fabric capacity inside the chamber as well as the optimal shrinking conditions.
5. **Steaming chamber fully made with stainless steel.** The steam feeding is done by means of one set of lower vats and one set of homogenisation nets that feeds the steam with the same pressure at all the wide and length of the chamber.
6. **Drop-free exclusive design** avoiding any condensation inside the chamber due to temperature changes between inside and outside the chamber and avoiding any drop on the processed fabric.
